DIvision 31 - Earthwork

Design Criteria
Site specific geotechnical and soil reports shall be referenced when determining excavation, compaction and backfilling requirements.

ExcaVation and Fill 31 23 00

Compaction
Vehicle Pavements: Compact top 12 inches of subgrade and each layer of backfill or fill material at 95 percent maximum density for cohesive materials or 95 percent relative density for cohesionless material.

Pedestrian Walkways: Compact top 6 inches of subgrade and each layer of backfill or fill material at 95 percent of maximum density for cohesive material or 95 percent relative density for cohesionless material.

Lawn or Unpaved Areas: Compact top 12 inches of subgrade and each layer of backfill or fill material at 85 percent maximum density for cohesive soils and 90 percent of relative density for cohesionless materials.

Trenching and Backfilling 31 23 33

Maximum allowable open trench is 600 linear feet at any one time. All trenches are to be covered at end of workday.

For trenches that cross existing asbestos-cement (AC) pipes, a portion of AC pipe must be cut out and replaced with plastic pipe. Replacing the AC pipe reduces the likelihood of pipe failure due to trench settlement. Refer to UCD standard drawing 888 for details and materials.

Warranty
Work shall be warranted against settlement for a period of 2 years after the date of final acceptance. Settlement shall be defined on paved surfaces as when the depression is 3/8-inch below the average of the sides of the uncut portion.
